Essential Information for Maintaining Your Investment

Wood, a natural product, is susceptible to changes in our climate and will absorb moisture in humid conditions and release moisture when the air is dry.

Our flooring products are maintained at an industry approved moisture content level and are ideal when installed in an environment where the ambient temperature is kept at between 68° - 72° and the relative humidity at 45° - 55°.

This can be achieved by removing excess moisture in the humid summer months with a humidifier, when the air is dry, after the heating system is turned on. You can monitor these conditions in your home with a simple humidistat/temperature gauge.

We cannot over stress the importance of following of following these guidelines and regret that we accept no responsibility for damages when the wood is exposed to changes in moisture content.

Enjoy The Beauty Of Your Wood Floor!
